### Introduction

Neurodata Without Borders: Neurophysiology is a project to develop a unified data format for cellular-based neurophysiology data, focused on the dynamics of groups of neurons measured under a large range of experimental conditions. Participating labs provided use cases and critical feedback to the effort. The design goals for the NWB format included:

#### Compatibility

- Cross-platform
- Support for tool makers

#### **Usability**

- Quickly develop a basic understanding of an experiment and its data
- Review an experiment's details without programming knowledge

#### **Flexibility**

- Accommodate an experiment's raw and processed data
- Encapsulate all of an experiment's data, or link to external data source when necessary

#### Extensibility

- Accommodate future experimental paradigms without sacrificing backwards compatibility.
- Support custom extensions when the standard is lacking

#### Longevity

Data published in the format should be accessible for decades

Hierarchical Data Format (HDF) was selected for the NWB format because it met several of the project's requirements. First, it is a mature data format standard with libraries available in multiple programming languages. Second, the format's hierarchical structure allows data to be grouped into logical self-documenting sections. Its structure is analogous to a file system in which its "groups" and "datasets" correspond to directories and files. Groups and datasets can have attributes that provide additional details, such as authorities' identifiers. Third, its linking feature enables data stored in one location to be transparently accessed from multiple locations in the hierarchy. The linked data can be external to the file. Fourth, HDFView, a free, crossplatform application, can be used to open a file and browse data. Finally, ensuring the ongoing accessibility of HDF-stored data is the mission of The HDF Group, the nonprofit that is the steward of the technology.

The NWB format standard is codified in a schema file written in a specification language created for this project. The specification language describes the schema, including data types and associations. A new schema file will be published for each revision of the NWB format standard. Data publishers can use the specification language to extend the format in order to store types of data not managed by the base format.

#### Naming conventions

In this document (and in the specification language used to define the format) an identifier enclosed in angle brackets (e.g. "<*ElectricalSeries*>") denotes a group or dataset with a "variable" name. That is, the name within the HDF5 file is set by the application creating the file and multiple instances may be created within the same group (each having a unique name). Identifiers that are not enclosed in angle brackets (e.g. "*CompassDirection*") are the actual name of the group or dataset within the HDF5 file. There can only be one instance within a given group since the name is fixed.

## Link types

In some instances, the specification refers to HDF5 links. When links are made within the file, HDF5 soft-links (and not hard-links) should be used. This is because soft-links distinguish between the link and the target of the link, whereas hard-links cause multiple names (paths) to be created for the target, and there is no way to determine which of these names are preferable in a given situation. If the target of a soft link is removed (or moved to another location in the HDF5 file)—both of which can be done using the HDF5 API—then the soft link will "dangle," that is point to a target that no longer exists. For this reason, moving or removing targets of soft links should be avoided unless the links are updated to point to the new location.

#### **Automatically created components**

In the format, the value of some datasets and attributes can usually be determined automatically from other parts of the HDF5 file. For example, a dataset that has as value the target of a link can be determined automatically from a list of links in the HDF5 file. When possible, the NWB API will automatically create such components and required groups. The components (datasets, attributes and required groups) that are automatically created by the API are indicated by the phrase (Automatically created) in the description or comment. The creation of these components is specified by the "autogen" option in the format specification language. This is not a part of the format (different API's may create the data files in different ways). The information is included for the convenience of those using the NWB API and also for developers of other APIs who may wish to also auto-generate these components.

Top level groups

ld	Description	Comment	Required
	Data streams recorded from the system,	This group is read-only after the experiment is completed and timestamps are corrected to a common timebase. The data stored here may be links to raw data stored in external HDF5 files. This will allow keeping bulky raw data out of the file while preserving the option of keeping some/all in the file. (Automatically created)	yes
analysis	Lab-specific and custom scientific analysis of data. There is no defined format for the content of this group - the format is up to the individual user/lab.	To facilitate sharing analysis data between labs, the contents here should be stored in standard types (eg, INCF types) and appropriately documented. (Automatically created)	yes
epochs		Epochs provide pointers to time series that are relevant to the epoch, and windows into the data in those time series (i.e., the start and end indices of TimeSeries::data[] that overlap with the epoch). This allows easy access to a range of data in specific experimental intervals. (Automatically created)	yes
general	Experimental metadata, including protocol, notes and description of hardware device(s).	The metadata stored in this section should be used to describe the experiment. Metadata necessary for interpreting the data is stored with the data. (Automatically created)	yes
processing	modules perform intermediate analysis of data that is necessary to perform before scientific analysis. Examples include spike clustering, extracting position from	Modules are defined below. They can be large and express many data sets from relatively complex analysis (e.g., spike detection and clustering) or small, representing extraction of position information from tracking video, or even binary lick/nolick decisions. Common software tools (e.g., klustakwik, MClust) are expected to read/write data here. (Automatically created)	yes
	Data pushed into the system (eg, video stimulus, sound, voltage, etc) and	This group is read-only after experiment complete and timestamps are corrected to common timebase. Stores both	
	I	0.400	

secondary representations of that data	presented stimuli and stimulus templates, the latter in case the	yes
(eg, measurements of something used as	same stimulus is presented multiple times, or is pulled from an	Ī
a stimulus)	external stimulus library. (Automatically created)	ı

The content of these organizational groups is more fully described in the section titled, File organization. The NWB format is based on *TimeSeries* and *Modules* and these are defined first.

NWB stores general optical and electrical physiology data in a way that should be understandable to a naive user after a few minutes using looking at the file in an HDF5 browser, such as HDFView. The format is designed to be friendly to and usable by software tools and analysis scripts, and to impose few a priori assumptions about data representation and analysis. Metadata required to understand the data itself (core metadata) is generally stored with the data. Information required to interpret the experiment (general metadata) is stored in the group 'general'. Most general metadata is stored in free-form text fields. Machine-readable metadata is stored as attributes on these free-form text fields.

The only API assumed necessary to read a NWB file is an HDF5 library (e.g., h5py in python, libhdf5 in C, JHI5 in Java).

#### Top level datasets

stimulus

Top-level datasets are for file identification and version information.

ld	Type	Description	Comment	Required
file_create_date	dims: ['*unlimited*']	subsequent	Date + time, Use ISO format (eg, ISO 8601) or a format that is easy to read and unambiguous. File can be created after the experiment was run, so this may differ from experiment start time. Each modifictation to file adds new entry to array.	yes
identifier	text	identifier for the file.	Eg, concatenated lab name, file creation date/time and experimentalist, or a hash of these and/or other values. The goal is that the string should be unique to all other files.	yes
nwb_version	text	File version string.	Eg, NWB-1.0.0. This will be the name of the format with trailing major, minor and patch numbers.	yes
session_description	text	One or two sentences describing the experiment and data in the file.		yes
session_start_time		experiment/session	Date + time, Use ISO format (eg, ISO 8601) or an easy-to-read and unambiguous format. All times stored in the file use this time as reference (ie, time zero)	yes

All times are stored in seconds using double precision (64 bit) floating point values. A smaller floating point value, e.g. 32 bit, is **not** permitted for storing times. This is because significant errors for time can result from using smaller data sizes. Throughout this document, sizes (number of bits) are provided for many datatypes (e.g. float32). If the size is followed by "!" then the size is the minimum size, otherwise it is the recommended size. For fields with a recommended size, larger or smaller sizes can be used (and for integer types both signed and unsigned), so long as the selected size encompasses the full range of data, and for floats, without loss of significant precision. Fields that have a minimum size can use larger, but not smaller sizes.

## **TimeSeries**

The file format is designed around a data structure called a *TimeSeries* which stores timevarying data. A *TimeSeries* is a superset of several INCF types, including signal events, image stacks and experimental events. To account for different storage requirements and different modalities, a *TimeSeries* is defined in a minimal form and it can be extended, or subclassed, to account for different modalities and data storage requirements. When a *TimeSeries* is extended, it means that the 'subclassed' instance maintains or changes each of the components (eg, groups and datasets) of its parent and may have new groups and/or datasets of its own. The *TimeSeries* makes this process of defining such pairs more hierarchical.

Each *TimeSeries* has its own HDF5 group, and all datasets belonging to a *TimeSeries* are in that

group. The group contains time and data components and users are free to add additional fields as necessary. There are two time objects represented. The first, *timestamps*, stores time information that is corrected to the experiment's time base (i.e., aligned to a master clock, with time-zero aligned to the starting time of the experiment). This field is used for data processing and subsequent scientific analysis. The second, *sync*, is an optional group that can be used to store the sample times as reported by the acquisition/stimulus hardware, before samples are converted to a common timebase and corrected relative to the master clock. This approach allows the NWB format to support streaming of data directly from hardware sources.

#### <TimeSeries>

General purpose time series.

ld	Туре	Description	Comment	Required
<timeseries></timeseries>	group	Top level group for <timeseries>. Nan</timeseries>	ne should be descriptive.	yes
. ancestry (attr)	text	The class-hierarchy of this TimeSeries, with one entry in the array for each ancestor. An alternative and equivalent description is that this TimeSeries object contains the datasets defined for all of the TimeSeries classes listed. The class hierarchy is described more fully below.	For example: [0]=TimeSeries, [1]=ElectricalSeries [2]=PatchClampSeries. The hierarchical order should be preserved in the array i.e., the parent object of subclassed element N in the array should be element N-1	yes
. comments (attr)	text	Human-readable comments about the descriptive field can be used to store a descriptive information if the primary dowith a computer-readable string.	dditional information, or	recommended
. data_link (attr)	text array; dims: ['num_dlinks']	A sorted list of the paths of all TimeSeries that share a link to the same data field. Example element of list: "/stimulus/presentation/Sweep_0"`	Attribute is only present if links are present. List should include the path to this TimeSeries also. (Automatically created)	yes
. description (attr)	text	Description of TimeSeries		recommended
. extern_fields (attr)	text array; dims: ['num_extern_fields']	List of fields that are HDF5 external links.	Only present if one or more datasets is set to an HDF5 external link. (Automatically created)	recommended
. help (attr)	text	Short description indicating what this ty	pe of TimeSeries stores.	no
. missing_fields (attr)	text array; dims: ['num_missing_fields']	List of fields that are not optional (i.e. either required or recommended parts of the TimeSeries) that are missing.	Only present if one or more required or recommended fields are missing. Note that a missing required field (such as data or timestamps) should generate an error by the API (Automatically created)	recommended
. neurodata_type (attr)	text	Value is the string "TimeSeries". (cons	t)	yes
. source (attr)	text	Name of TimeSeries or Modules that s contained here. It can also be the name acquisition data		yes
. timestamp_link (attr)	text array; dims: ['num_tslinks']	A sorted list of the paths of all TimeSeries that share a link to the same timestamps field. Example element of list: "/acquisition/timeseries/lick_trace"	Attribute is only present if links are present. List should include the path to this TimeSeries also. (Automatically created)	yes
. control	uint8 array; dims: ['num_times']	Numerical labels that apply to each element in data[].	Optional field. If present, the control array should have the same number of elements as data[]. If either control or control_description are present, then both must be present.	no
	text array; dims:	5/20	Array length should be as long as the highest number in control minus one, generating an zero-based indexed array	

. control_descriptior	ı[ˈnum_control_valuesˈ]	Description of each control value.	for control values. If either control or control_description are present, then both must be present.	no
. data	any array; dims: ['num_times']	Data values. Can also store binary data (eg, image frames)	This field may be a link to data stored in an external file, especially in the case of raw data.	yes
conversion (attr)	float32!	Scalar to multiply each element in data unit	to convert it to the specified	yes
resolution (attr)	float32!		E.g., the change in value of the least significant bit, or a larger number if signal noise is known to be present. If unknown, use NaN	yes
unit (attr)	text	The base unit of measure used to store data. This should be in the SI unit.	This is the SI unit (when appropriate) of the stored data, such as Volts. If the actual data is stored in millivolts, the field 'conversion' below describes how to convert the data to the specified SI unit.	yes
. num_samples	int32	Number of samples in data, or number of image frames.	This is important if the length of timestamp and data are	yes
. starting_time	float64!	The timestamp of the first sample.	from the sampling rate. Either starting_time or timestamps must be present, but not both.	no
rate (attr)	float32!	Sampling rate, in Hz	Rate information is stored in Hz	yes
unit (attr)	text	The string "Seconds"	All timestamps in the file are stored in seconds. Specifically, this is the number of seconds since the start of the experiment (i.e., since session_start_time)	yes
. sync	group	Lab specific time and sync information as provided directly from hardware devices and that is necessary for aligning all acquired time information to a common timebase. The timestamp array stores time in the common timebase.	This group will usually only be populated in TimeSeries that are stored external to the NWB file, in files storing raw data. Once timestamp data is calculated, the contents of 'sync' are mostly for archival purposes.	no
. timestamps	float64! array; dims: ['num_times']	Timestamps for samples stored in data.	Timestamps here have all been corrected to the common experiment master-clock. Time is stored as seconds and all timestamps are relative to experiment start time. Either starting_time or timestamps must be present, but not both.	yes
interval (attr)	int32	The number of samples between each timestamp.	timestamp for each sample)	yes
			All timestamps in the file are stored in seconds.	

unit (attr) text The string "Seconds"	Specifically, this is the number of seconds since the start of the experiment (i.e., since session_start_time)
---------------------------------------	--

When data is streamed from experiment hardware it should be stored in an HDF5 dataset having the same attributes as *data*, with time information stored as necessary. This allows the raw data files to be separate file-system objects that can be set as read-only once the experiment is complete. *TimeSeries* objects in /acquisition will link to the *data* field in the raw time series. Hardware-recorded time data must be corrected to a common time base (e.g., timestamps from all hardware sources aligned) before it can be included in *timestamps*. The uncorrected time can be stored in the *sync* group.

The group holding the *TimeSeries* can be used to store additional information (HDF5 datasets) beyond what is required by the specification. I.e., an end user is free to add additional key/value pairs as necessary for their needs. It should be noted that such lab-specific extensions may not be recognized by analysis tools/scripts existing outside the lab. Extensions are described in section Extending the format).

The *data* element in the *TimeSeries* will typically be an array of any valid HDF5 data type (e.g., a multi-dimentsional floating point array). The data stored can be in any unit. The attributes of the data field must indicate the SI unit that the data relates to (or appropriate counterpart, such as color-space) and the multiplier necessary to convert stored values to the specified SI unit.

## **TimeSeries Class Hierarchy**

The *TimeSeries* is a data structure/object. It can be "subclassed" (or extended) to represent more narrowly focused modalities (e.g., electrical versus optical physiology) as well as new modalities (eg, video tracking of whisker positions). When it a *TimeSeries* is subclassed, new datasets can be added while all datasets of parent classes are either preserved as specified in the parent class or replaced by a new definition (changed). In the tables that follow, identifiers in the "Id" column that change the definition in the parent class are <u>underlined</u>. An initial set of subclasses are described here. Users are free to define subclasses for their particular requirements. This can be done by creating an extension to the format defining a new *TimeSeries* subclass (see Extending the format).

All datasets that are defined to be part of TimeSeries have the text attribute 'unit' that stores the unit specified in the documentation.

#### <AbstractFeatureSeries> extends <TimeSeries>

Abstract features, such as quantitative descriptions of sensory stimuli. The TimeSeries::data field is a 2D array, storing those features (e.g., for visual grating stimulus this might be orientation, spatial frequency and contrast). Null stimuli (eg, uniform gray) can be marked as being an independent feature (eg, 1.0 for gray, 0.0 for actual stimulus) or by storing NaNs for feature values, or through use of the TimeSeries::control fields. A set of features is considered to persist until the next set of features is defined. The final set of features stored should be the null set.

<AbstractFeatureSeries> includes all elements of <TimeSeries> with the following additions
or changes:

ld	Туре	Description	Comment	Required	
<abstractfeatureseries></abstractfeatureseries>	group	Top level group for <abstraction descriptive.<="" td=""><td>yes</td></abstraction>	yes		
. ancestry (attr)	text array; dims: ['2']	Value is ['TimeSeries', 'Abstr	Value is ['TimeSeries', 'AbstractFeatureSeries'] (const)		
. help (attr)	text	Value is the string "Features of an applied stimulus. This is useful when storing the raw stimulus is impractical". (const)		no	
data	float32 array; dims: ['num_times', 'num_features']	Values of each feature at each time.		yes	
conversion (attr)	float32!	Scalar to multiply each element in data to convert it to the specified unit		yes	

resolution (attr)	float32!	Smallest meaningful difference between values in data, stored in the specified by unit.	E.g., the change in value of the least significant bit, or a larger number if signal noise is known to be present. If unknown, use NaN	yes
unit (attr <u>)</u>	text	Value is the string "see 'feat	/alue is the string "see 'feature_units'".	
. feature_units	text array; dims: ['num_features']	Units of each feature.		recommended
. features	text array; dims: ['num_features']	Description of the features represented in TimeSeries::data.		yes

#### <AnnotationSeries> extends <TimeSeries>

Stores, eg, user annotations made during an experiment. The TimeSeries::data[] field stores a text array, and timestamps are stored for each annotation (ie, interval=1). This is largely an alias to a standard TimeSeries storing a text array but that is identifiable as storing annotations in a machine-readable way.

<AnnotationSeries> includes all elements of <TimeSeries> with the following additions or changes:

ld Type		Description	Required
<annotationseries></annotationseries>	group	Top level group for <annotationseries>. Name should be descriptive.</annotationseries>	yes
. ancestry (attr)	ancestry (attr) text array; dims: ['2'] Value is ['TimeSeries', 'AnnotationSeries'] (const)		yes
<u>. help (attr)</u>	text	Value is the string "Time-stamped annotations about an experiment". (const)	no
<u>. data</u>	text array; dims: ['num_times']	Annotations made during an experiment.	yes
conversion (attr)	float32!	Value is float('NaN') (const) since this does not apply.	yes
resolution (attr)	float32!	Value is float('nan') (const) since this does not apply	yes
unit (attr)	text	Value is "n/a" to indicate that this does not apply	yes

#### <ElectricalSeries> extends <TimeSeries>

Stores acquired voltage data from extracellular recordings. The data field of an ElectricalSeries is an int or float array storing data in Volts. TimeSeries::data array structure: [num times] [num channels] (or [num\_times] for single electrode).

<ElectricalSeries> includes all elements of <TimeSeries> with the the following additions or changes:

ld	Туре	Description	Comment	Required
<electricalseries></electricalseries>	group	Top level group for <electrica< td=""><td>ISeries&gt;. Name should be descriptive.</td><td>yes</td></electrica<>	ISeries>. Name should be descriptive.	yes
. ancestry (attr)	text array; dims: ['2']	Value is ['TimeSeries', 'Electri	icalSeries'] (const)	yes
<u>. help (attr)</u>	text	Value is the string "Stores acrecordings". (const)	quired voltage data from extracellular	no
<u>. data</u>	number array; dims: [['num_times'], ['num_times', 'num_channels']]	Recorded voltage data.		
conversion (attr)	float32!	Scalar to multiply each eleme	ent in data to convert it to the specified unit	yes
resolution (attr)	110at32!	Smallest meaningful E.g., the change in value of the least difference between values in significant bit, or a larger number if signal data, stored in the specified by unit.  E.g., the change in value of the least significant bit, or a larger number if signal noise is known to be present. If unknown, use NaN		yes
unit (attr)	text	Value is the string "volt".		
. electrode_idx		Indicies (zero-based) to electrodes in general/extracellular_ephys/electrode_map.		

## <SpikeEventSeries> extends <ElectricalSeries>

Stores "snapshots" of spike events (i.e., threshold crossings) in data. This may also be raw data, as reported by ephys hardware. If so, the TimeSeries::description field should describing how events were detected. All SpikeEventSeries should reside in a module (under EventWaveform interface) even if the spikes were reported and stored by hardware. All events span the same recording channels and store snapshots of equal duration. TimeSeries::data array structure:

[num events] [num channels] [num samples] (or [num events] [num samples] for single electrode).

<SpikeEventSeries> includes all elements of <ElectricalSeries> with the following additions

or changes:

Id	Туре	Description	Comment	Required
<spikeeventseries></spikeeventseries>	group	Top level group for <spikeeventseries>. Name should be descriptive.</spikeeventseries>		yes
. ancestry (attr)	text array; dims: ['3']	Value is ['TimeSeries', 'Ele (const)	ectricalSeries', 'SpikeEventSeries']	yes
. help (attr)	text	Value is the string "Snaps (const)	hots of spike events from data.".	no
<u>. data</u>	float32 array; dims: [['num_events', 'num_samples'], ['num_events', 'num_channels', 'num_samples']]	Spike waveforms.		yes
conversion (attr)	float32!	Scalar to multiply each element in data to convert it to the specified unit		yes
resolution (attr)	float32!	Smallest meaningful difference between values in data, stored in the specified by unit.  E.g., the change in value of the least significant bit, or a larger number if signal noise is known to be present. If unknown, use NaN		yes
unit (attr)	text	Value is the string "volt".		yes

#### <ImageSeries> extends <TimeSeries>

General image data that is common between acquisition and stimulus time series. Sometimes the image data is stored in the HDF5 file in a raw format while other times it will be stored as an external image file in the host file system. The data field will either be binary data or empty. TimeSeries::data array structure: [frame] [y][x] or [frame][z][y][x].

</mageSeries> includes all elements of <TimeSeries> with the the following additions or

changes.

<u>changes</u> :					
ld	Type	Description	Comment	Required	
<imageseries></imageseries>	group	Top level group for < Imag	yes		
. ancestry (attr)	text array; dims: ['2']	Value is ['TimeSeries', 'In	nageSeries'] (const)	yes	
. help (attr)	text	Value is the string "Storage	ge object for time-series 2-D image data". (const)	no	
. bits_per_pixel	int32	Number of bit per image	pixel.	recommended	
<u>. data</u>			Either binary data containing image or empty. Either 'external_file' or 'data' nust be specified, but not both		
conversion (attr)	float32!	Scalar to multiply each el	ement in data to convert it to the specified unit	yes	
resolution (attr)	float32!	Smallest meaningful difference between values in data, stored in the specified by unit.	E.g., the change in value of the least significant bit, or a larger number if signal noise is known to be present. If unknown, use NaN	yes	
unit (attr)	text	The base unit of measure used to store data. This should be in the SI unit.	This is the SI unit (when appropriate) of the stored data, such as Volts. If the actual data is stored in millivolts, the field 'conversion' below describes how to convert the data to the specified SI unit.	yes	
. dimension	int32 array; dims: ['rank']	Number of pixels on x, y,	(and z) axes.	recommended	
. external_file	text array; dims: ['num_files']	•	no		
starting_frame (attr)	['num_files']	the corresponding extern each file contains, allowir	r 'data' must be specified, but not both ach entry is the frame number (within the full ImageSeries) of the first frame in the corresponding external_file entry. This serves as an index to what frames ach file contains, allowing random access.Zero-based indexing is used. (The test element will always be zero).		

. format	text	Format of image. If this is 'external' then the field external_file contains the path or URL information to that file. For tiff, png, jpg, etc, the binary representation of the image is stored in data. If the format is raw then the fields bit_per_pixel and dimension are used. For raw images, only a single channel is stored (eg, red).	recommended
----------	------	---	-------------

#### <ImageMaskSeries> extends <ImageSeries>

An alpha mask that is applied to a presented visual stimulus. The data[] array contains an array of mask values that are applied to the displayed image. Mask values are stored as RGBA. Mask can vary with time. The timestamps array indicates the starting time of a mask, and that mask pattern continues until it's explicitly changed.

</mageMaskSeries> includes all elements of </mageSeries> with the following additions or

changes:

ld	Туре	Description	Required
<imagemaskseries></imagemaskseries>	group	Top level group for <imagemaskseries>. Name should be descriptive.</imagemaskseries>	yes
. ancestry (attr)	text array; dims: ['3']	Value is ['TimeSeries', 'ImageSeries', 'ImageMaskSeries'] (const)	yes
. help (attr)		Value is the string "An alpha mask that is applied to a presented visual stimulus". (const)	no
. masked_imageseries	link; target type= <lmageseries></lmageseries>	Link to ImageSeries that mask is applied to.	yes
. masked_imageseries_path	text	Path to linked ImageSeries (Automatically created)	yes

## <OpticalSeries> extends <ImageSeries>

Image data that is presented or recorded. A stimulus template movie will be stored only as an image. When the image is presented as stimulus, additional data is required, such as field of view (eg, how much of the visual field the image covers, or how what is the area of the target being imaged). If the OpticalSeries represents acquired imaging data, orientation is also important.

< OpticalSeries > includes all elements of < ImageSeries > with the following additions or

changes:

ld	Туре	Description	Required
<opticalseries> group</opticalseries>		Top level group for <opticalseries>. Name should be descriptive.</opticalseries>	yes
. ancestry (attr)	ncestry (attr) text array; dims: Value is ['TimeSeries', 'ImageSeries', 'OpticalSeries'] (const)		yes
. help (attr) text Value is the string "Time-series image stack for optical recording or st (const)		Value is the string "Time-series image stack for optical recording or stimulus". (const)	no
. distance float32 Dis		Distance from camera/monitor to target/eye.	recommended
. field_of_view float32 array; dims: ['fov']		Width, height and depto of image, or imaged area (meters).	recommended
		Description of image relative to some reference frame (e.g., which way is up). Must also specify frame of reference.	recommended

#### Structured dimension(s):

Dimension	Components [ name (unit) ]			
fov (option 1)	width (meter)	height (meter)		
fov (option 2)	width (meter)	height (meter)	depth (meter)	

## <TwoPhotonSeries> extends <!mageSeries>

A special case of optical imaging.

<TwoPhotonSeries> includes all elements of <ImageSeries> with the following additions or changes:

ld	Туре	Description	Required
<twophotonseries></twophotonseries>	group	Top level group for <twophotonseries>. Name should be descriptive.</twophotonseries>	yes
. ancestry (attr)	text array; dims: ['3']	Value is ['TimeSeries', 'ImageSeries', 'TwoPhotonSeries'] (const)	yes
. help (attr)	text	Value is the string "Image stack recorded from 2-photon microscope". (const)	no
	float32 array; dims:	Width, height and depth of image, or imaged area (meters).	recommended

	['whd']		
. imaging_plane	text	Name of imaging plane description in /general/optophysiology.	yes
. pmt_gain	float32	Photomultiplier gain	recommended
. scan_line_rate	float32	Lines imaged per second. This is also stored in /general/optophysiology but is kept here as it is useful information for analysis, and so good to be stored w/ the actual data.	recommended

#### Structured dimension(s):

Dimension	Components [ name (unit) ]			
whd	width (meter)	height (meter)	depth (meter)	

#### <IndexSeries> extends <TimeSeries>

Stores indices to image frames stored in an ImageSeries. The purpose of the ImageIndexSeries is to allow a static image stack to be stored somewhere, and the images in the stack to be referenced out-of-order. This can be for the display of individual images, or of movie segments (as a movie is simply a series of images). The data field stores the index of the frame in the referenced ImageSeries, and the timestamps array indicates when that image was displayed. <IndexSeries> includes all elements of <TimeSeries> with the following additions or changes:

ld	Туре	Description	Comment	Required
<indexseries></indexseries>	group	Top level group for <i< td=""><td>ndexSeries&gt;. Name should be descriptive.</td><td>yes</td></i<>	ndexSeries>. Name should be descriptive.	yes
. ancestry (attr)	text array; dims: ['2']	Value is ['TimeSeries	', 'IndexSeries'] (const)	yes
. help (attr)	text	image stack. Frames	sequence that is generated from an existing can be presented in an arbitrary order. The ne number in reference stack". (const)	no
. data	int array; dims: ['num_times']	Index of the frame in	the referenced ImageSeries.	yes
conversion (attr)	float32!	Scalar to multiply eac unit	h element in data to convert it to the specified	yes
resolution (attr)	float32!	Smallest meaningful difference between values in data, stored in the specified by unit.	E.g., the change in value of the least significant bit, or a larger number if signal noise is known to be present. If unknown, use NaN	yes
unit (attr)	text	The base unit of measure used to store data. This should be in the SI unit.	This is the SI unit (when appropriate) of the stored data, such as Volts. If the actual data is stored in millivolts, the field 'conversion' below describes how to convert the data to the specified SI unit.	
. indexed_timeseries	link; target type= <lmageseries></lmageseries>	HDF5 link to TimeSe	ries containing images that are indexed.	yes
. indexed_timeseries_path	text	Path to linked TimeSe	eries (Automatically created)	yes

#### <IntervalSeries> extends <TimeSeries>

Stores intervals of data. The timestamps field stores the beginning and end of intervals. The data field stores whether the interval just started (>0 value) or ended (<0 value). Different interval types can be represented in the same series by using multiple key values (eg, 1 for feature A, 2 for feature B, 3 for feature C, etc). The field data stores an 8-bit integer. This is largely an alias of a standard TimeSeries but that is identifiable as representing time intervals in a machine-readable way.

<IntervalSeries> includes all elements of <TimeSeries> with the the following additions or changes:

ld	Туре	Description	Required
<intervalseries></intervalseries>	group	Top level group for <intervalseries>. Name should be descriptive.</intervalseries>	yes
<u>. ancestry (attr)</u>	text array; dims: ['2']	Value is ['TimeSeries', 'IntervalSeries'] (const)	yes
. help (attr)	text	Value is the string "Stores the start and stop times for events". (const)	no
. data	int8 array; dims: ['num_times']	>0 if interval started, <0 if interval ended.	yes
conversion			

(attr)	float32!	Value is the number "nan"	yes	
resolution (attr)	float32!	Value is the number "nan"	yes	
<u> unit (attr)</u>	text	Value is the string "n/a".	yes	

## <OptogeneticSeries> extends <TimeSeries>

Optogenetic stimulus. The data[] field is in unit of watts.

<OptogeneticSeries> includes all elements of <TimeSeries> with the following additions or <a href="mailto:changes">changes</a>:

ld	Туре	Description	Comment	Required
<optogeneticseries></optogeneticseries>	group	Top level group for <optogenetion< td=""><td>Series&gt;. Name should be descriptive.</td><td>yes</td></optogenetion<>	Series>. Name should be descriptive.	yes
	text array; dims: ['2']	Value is ['TimeSeries', 'Optogen	alue is ['TimeSeries', 'OptogeneticSeries'] (const)	
<u>. help (attr)</u>	text	Value is the string "Optogenetic	stimulus". (const)	no
<u>. data</u>	float32 array; dims: ['num_times']	Applied power for optogenetic st	oplied power for optogenetic stimulus.	
conversion (attr)	float32!	Scalar to multiply each element	calar to multiply each element in data to convert it to the specified unit	
resolution (attr)		between values in data, stored	E.g., the change in value of the least significant bit, or a larger number if signal noise is known to be present. If unknown, use NaN	yes
<u> unit (attr)</u>	text	Value is the string "watt".		yes
. site	text	Name of site description in gene	ame of site description in general/optogentics.	

#### <PatchClampSeries> extends <TimeSeries>

Stores stimulus or response current or voltage. Superclass definition for patch-clamp data (this class should not be instantiated directly).

<PatchClampSeries> includes all elements of <TimeSeries> with the following additions or changes:

Id	Туре	Description	Comment	Required	
<patchclampseries></patchclampseries>	group	Top level group for <pat< td=""><td colspan="3">op level group for <patchclampseries>. Name should be descriptive.</patchclampseries></td></pat<>	op level group for <patchclampseries>. Name should be descriptive.</patchclampseries>		
	text array; dims: ['2']	Value is ['TimeSeries', 'F	alue is ['TimeSeries', 'PatchClampSeries'] (const)		
. help (attr)	text	Value is the string "Supe	erclass definition for patch-clamp data". (const)	no	
	number array; dims: ['num_times']	Recorded voltage or cur	ecorded voltage or current.		
conversion (attr)	float32!	Scalar to multiply each e	Scalar to multiply each element in data to convert it to the specified unit		
resolution (attr)	float32!	Smallest meaningful difference between values in data, stored in the specified by unit.  E.g., the change in value of the least significant bit, or a larger number if signal noise is known to be present. If unknown, use NaN		yes	
unit (attr)	text	The base unit of measure used to store data. This should be in the SI unit.  This is the SI unit (when appropriate) of the stored data, such as Volts. If the actual data is stored in millivolts, the field 'conversion' below describes how to convert the data to the specified SI unit.		yes	
. electrode_name	text	Name of electrode entry in /general/intracellular_ephys.		yes	
. gain	float	Units: Volt/Amp (v-clamp	recommended		

## <CurrentClampSeries> extends <PatchClampSeries>

Stores voltage data recorded from intracellular current-clamp recordings. A corresponding CurrentClampStimulusSeries (stored separately as a stimulus) is used to store the current injected.

<CurrentClampSeries> includes all elements of <PatchClampSeries> with the following additions or changes:

ld	Туре	Description	Required
<currentclampseries></currentclampseries>		Top level group for <currentclampseries>. Name should be descriptive.</currentclampseries>	yes
I ancastry (attri	text array; dims: ['3']	Value is ['TimeSeries', 'PatchClampSeries', 'CurrentClampSeries'] (const)	yes
. help (attr)	text	Value is the string "Voltage recorded from cell during current-clamp	no

	•	recording". (const)	
. bias_current	float32	Unit: Amp	recommended
. bridge_balance	float32	Unit: Ohm	recommended
. capacitance_compensation	float32	Unit: Farad	recommended

## <IZeroClampSeries> extends <CurrentClampSeries>

Stores recorded voltage data from intracellular recordings when all current and amplifier settings are off (i.e., CurrentClampSeries fields will be zero). There is no CurrentClampStimulusSeries associated with an IZero series because the amplifier is disconnected and no stimulus can reach the cell.

</ZeroClampSeries> includes all elements of <CurrentClampSeries> with the following
additions or changes:

ld	Type	Description	Required
<izeroclampseries></izeroclampseries>	group	Top level group for <izeroclampseries>. Name should be descriptive.</izeroclampseries>	yes
I ancestry (attri		Value is ['TimeSeries', 'PatchClampSeries', 'CurrentClampSeries', 'IZeroClampSeries'] (const)	yes
. help (attr)		Value is the string "Voltage from intracellular recordings when all current and amplifier settings are off". (const)	no

## <CurrentClampStimulusSeries> extends <PatchClampSeries>

Aliases to standard PatchClampSeries. Its functionality is to better tag PatchClampSeries for machine (and human) readability of the file.

<CurrentClampStimulusSeries> includes all elements of <PatchClampSeries> with the the following additions or changes:

Id	Туре	Description	Required
<currentclampstimulusseries></currentclampstimulusseries>	1(11(1)11()	Top level group for <currentclampstimulusseries>. Name should be descriptive.</currentclampstimulusseries>	yes
I ancestry lattri		Value is ['TimeSeries', 'PatchClampSeries', 'CurrentClampStimulusSeries'] (const)	yes
. help (attr)	II A X I	Value is the string "Stimulus current applied during current clamp recording". (const)	no

## <VoltageClampSeries> extends <PatchClampSeries>

Stores current data recorded from intracellular voltage-clamp recordings. A corresponding VoltageClampStimulusSeries (stored separately as a stimulus) is used to store the voltage injected.

<VoltageClampSeries> includes all elements of <PatchClampSeries> with the following additions or <a href="mailto:changes">changes</a>:

ld	Type	Description	Required
<voltageclampseries></voltageclampseries>	group	Top level group for <voltageclampseries>. Name should be descriptive.</voltageclampseries>	yes
<u>. ancestry (attr)</u>	text array; dims: ['3']	Value is ['TimeSeries', 'PatchClampSeries', 'VoltageClampSeries'] (const)	yes
. help (attr)	text	Value is the string "Current recorded from cell during voltage-clamp recording". (const)	no
. capacitance_fast	float32	Unit: Farad	recommended
unit (attr)	text	Value is the string "Farad".	yes
. capacitance_slow	float32	Unit: Farad	recommended
unit (attr)	text	Value is the string "Farad".	yes
. resistance_comp_bandwidth	float32	Unit: Hz	recommended
unit (attr)	text	Value is the string "Hz".	yes
. resistance_comp_correction	float32	Unit: %	recommended
unit (attr)	text	Value is the string "pecent".	yes
. resistance_comp_prediction	float32	Unit: %	recommended
unit (attr)	text	Value is the string "pecent".	yes
. whole_cell_capacitance_comp	float32	Unit: Farad	recommended
unit (attr)	text	Value is the string "Farad".	yes
. whole_cell_series_resistance_comp	float32	Unit: Ohm	recommended

. . unit (attr) text Value is the string "Ohm". yes

## <VoltageClampStimulusSeries> extends <PatchClampSeries>

Aliases to standard PatchClampSeries. Its functionality is to better tag PatchClampSeries for machine (and human) readability of the file.

<VoltageClampStimulusSeries> includes all elements of<PatchClampSeries> with the the

following additions or changes:

ld	Type	Description	Required
<voltageclampstimulusseries></voltageclampstimulusseries>		Top level group for <voltageclampstimulusseries>. Name should be descriptive.</voltageclampstimulusseries>	yes
I ancastry rattri		Value is ['TimeSeries', 'PatchClampSeries',  'VoltageClampStimulusSeries'] (const)	yes
. help (attr)	ΙΤΔΥΤ	Value is the string "Stimulus voltage applied during voltage clamp recording". (const)	no

#### <RoiResponseSeries> extends <TimeSeries>

ROI responses over an imaging plane. Each row in data[] should correspond to the signal from one ROI.

<RoiResponseSeries> includes all elements of <TimeSeries> with the following additions or

changes:

ld	Туре	Description	Comment	Required
<roiresponseseries></roiresponseseries>	group	Top level group for be descriptive.	<roiresponseseries>. Name should</roiresponseseries>	yes
. ancestry (attr)	text array; dims: ['2']	Value is ['TimeSeri	es', 'RoiResponseSeries'] (const)	yes
. help (attr)			'ROI responses over an imaging plane. should correspond to the signal from one	no
<u>. data</u>	float32 array; dims: ['num_times', 'num_ROIs']	Signals from ROIs		yes
conversion (attr)	float32!	Scalar to multiply e specified unit	ach element in data to convert it to the	yes
resolution (attr)	float32!		E.g., the change in value of the least significant bit, or a larger number if signal noise is known to be present. If unknown, use NaN	yes
unit (attr)	text	The base unit of measure used to store data. This should be in the SI unit.	This is the SI unit (when appropriate) of the stored data, such as Volts. If the actual data is stored in millivolts, the field 'conversion' below describes how to convert the data to the specified SI unit.	yes
. roi_names	text array; dims: ['num_ROIs']	List of ROIs repres	ented, one name for each row of data[].	yes
. segmentation_interface	link; target type=ImageSegmentation	HDF5 link to image	segmentation module defining ROIs.	yes
. segmentation_interface_path	text	Path to segmentati	on module. (Automatically created)	yes

## <SpatialSeries> extends <TimeSeries>

Direction, e.g., of gaze or travel, or position. The TimeSeries::data field is a 2D array storing position or direction relative to some reference frame. Array structure: [num measurements] [num dimensions]. Each SpatialSeries has a text dataset reference\_frame that indicates the zero-position, or the zero-axes for direction. For example, if representing gaze direction, "straight-ahead" might be a specific pixel on the monitor, or some other point in space. For position data, the 0,0 point might be the top-left corner of an enclosure, as viewed from the tracking camera. The unit of data will indicate how to interpret SpatialSeries values.

<SpatialSeries> includes all elements of <TimeSeries> with the the following additions or changes:

ld	Туре	Description	Comment	Required
		4.4.00		

<spatialseries></spatialseries>	group	Top level group for <spatialse< td=""><td>ries&gt;. Name should be descriptive.</td><td>yes</td></spatialse<>	ries>. Name should be descriptive.	yes
. ancestry (attr)	text array; dims: ['2']	Value is ['TimeSeries', 'Spatial	Series'] (const)	yes
. help (attr)	text		Value is the string "Stores points in space over time. The data[] array structure is [num samples][num spatial dimensions]". (const)	
<u>. data</u>	number array; dims: ['num_times', 'num_features']	2-D array storing position or direction relative to some reference frame.		yes
conversion (attr)	float32!	Scalar to multiply each elemer	Scalar to multiply each element in data to convert it to the specified unit	
resolution (attr)	float32!	Smallest meaningful difference between values in data, stored in the specified by unit.	E.g., the change in value of the least significant bit, or a larger number if signal noise is known to be present. If unknown, use NaN	yes
unit (attr <u>)</u>	text			yes
. reference_frame	text			recommended

#### **Modules**

NWB uses *modules* to store data for—and represent the results of—common data processing steps, such as spike sorting and image segmentation, that occur before scientific analysis of the data. Modules store the data used by software tools to calculate these intermediate results. Each module provides a list of the data it makes available, and it is free to provide whatever additional data that the module generates. Additional documentation is required for data that goes beyond standard definitions. All modules are stored directly under group /processing. The name of each module is chosen by the data provider (i.e. modules have a "variable" name). The particular data within each module is specified by one or more *interfaces*, which are groups residing directly within a module. Each interface extends (contains the attributes in) group 
Interface> and has a fixed name (e.g. ImageSegmentation) that suggests the type of data it contains. The names of the interfaces within a given module are listed in the "interfaces" attribute for the module. The different types of Interfaces are described below.

#### <Interface>

The attributes specified here are included in all interfaces.

ld	Туре	Description	Required
<interface></interface>	group	Top level group for <interface>. This is an abstract group which can only be used by subclassing.</interface>	yes
. help (attr)			no
. neurodata_type (attr)	text	Value is the string "Interface".	yes
. source (attr)	text	Path to the origin of the data represented in this interface.	yes

## **BehavioralEpochs**

TimeSeries for storing behavoioral epochs. The objective of this and the other two Behavioral interfaces (e.g. BehavioralEvents and BehavioralTimeSeries) is to provide generic hooks for software tools/scripts. This allows a tool/script to take the output one specific interface (e.g., UnitTimes) and plot that data relative to another data modality (e.g., behavioral events) without having to define all possible modalities in advance. Declaring one of these interfaces means that one or more TimeSeries of the specified type is published. These TimeSeries should reside in a group having the same name as the interface. For example, if a BehavioralTimeSeries interface is declared, the module will have one or more TimeSeries defined in the module sub-group "BehavioralTimeSeries". BehavioralEpochs should use IntervalSeries. BehavioralEvents is used for irregular events. BehavioralTimeSeries is for continuous data.

BehavioralEpochs includes all elements of < Interface > with the the following additions or changes:

ld	Туре	Description	Required
BehavioralEpochs	group	Top level group for BehavioralEpochs.	yes

<u>. help (attr)</u>	text	Value is the string "General container for storing behavorial epochs". (const)	no
. <intervalseries></intervalseries>	group	Stores intervals of data.	no

#### **BehavioralEvents**

TimeSeries for storing behavioral events. See description of Behavioral Epochs for more details. Behavioral Events includes all elements of Interface with the the following additions or changes:

ld	Туре	Description	
BehavioralEvents	group	op level group for BehavioralEvents.	
<u>. help (attr)</u>	text	alue is the string "Position data, whether along the x, xy or xyz axis". (const)	
. <timeseries></timeseries>	group	General purpose time series.	no

#### **BehavioralTimeSeries**

TimeSeries for storing Behavoioral time series data. See description of Behavioral Epochs for more details.

BehavioralTimeSeries includes all elements of < Interface > with the following additions or changes:

ld	Туре	Description	Required
BehavioralTimeSeries	group	Top level group for BehavioralTimeSeries.	yes
. <timeseries></timeseries>	group	General purpose time series.	no

#### **ClusterWaveforms**

The mean waveform shape, including standard deviation, of the different clusters. Ideally, the waveform analysis should be performed on data that is only high-pass filtered. This is a separate module because it is expected to require updating. For example, IMEC probes may require different storage requirements to store/display mean waveforms, requiring a new interface or an extension of this one.

ClusterWaveforms includes all elements of < Interface > with the the following additions or changes:

ld	Туре	Description	Required
ClusterWaveforms	group	Top level group for ClusterWaveforms.	yes
. help (attr) text		Value is the string "Mean waveform shape of clusters. Waveforms should be high-pass filtered (ie, not the same bandpass filter used waveform analysis and clustering)". (const)	no
	link; target type=Clustering	HDF5 link to Clustering interface that was the source of the clustered data	yes
. clustering_interface_path	text	Path to linked clustering interface (Automatically created)	yes
. waveform_filtering	text	Filtering applied to data before generating mean/sd	yes
wayeform mean	['num_clusters',	The mean waveform for each cluster, using the same indices for each wave as cluster numbers in the associated Clustering module (i.e, cluster 3 is in array slot [3]). Waveforms corresponding to gaps in cluster sequence should be empty (e.g., zero- filled)	yes
wayeform ed	float32 array; dims: ['num_clusters', 'num_samples']	Stdev of waveforms for each cluster, using the same indices as in mean	yes

#### Clustering

Clustered spike data, whether from automatic clustering tools (e.g., klustakwik) or as a result of manual sorting.

Clustering includes all elements of < Interface > with the following additions or changes:

tractoring includes an elements of methads with the tree following additions of chariges.				
ld	Туре	Description	Required	
Clustering	group	Top level group for Clustering.	yes	
. help (attr)	text	Value is the string "Clustered spike data, whether from automatic clustering tools (eg, klustakwik) or as a result of manual sorting". (const)	no	
. cluster_nums		List of cluster number that are a part of this set (cluster numbers can be non-continuous) (Automatically created)	yes	
		Description of clusters or clustering, (e.g. cluster 0 is noise, clusters curated		

. description	text	using Klusters, etc)	yes
	int32 array; dims: ['num_events']	Cluster number of each event	yes
. peak_over_rms		Maximum ratio of waveform peak to RMS on any channel in the cluster (provides a basic clustering metric).	yes
times	float64! array; dims:	Times of clustered events, in seconds. This may be a link to times field in associated FeatureExtraction module.	yes

#### CompassDirection

With a CompassDirection interface, a module publishes a SpatialSeries object representing a floating point value for theta. The SpatialSeries::reference\_frame field should indicate what direction corresponds to 0 and which is the direction of rotation (this should be clockwise). The si\_unit for the SpatialSeries should be radians or degrees.

CompassDirection includes all elements of < Interface > with the the following additions or changes:

ld	Туре	Description	Required
CompassDirection	group	Top level group for CompassDirection.	
<u>. help (attr)</u>	text	Value is the string "Direction as measured radially. Spatial series reference frame should indicate which direction corresponds to zero and what is the direction of positive rotation". (const)	no
. <spatialseries></spatialseries>	group	Direction, e.g., of gaze or travel, or position.	no

#### **DfOverF**

dF/F information about a region of interest (ROI). Storage hierarchy of dF/F should be the same as for segmentation (ie, same names for ROIs and for image planes).

*DfOverF* includes all elements of <*Interface*> with the following additions orchanges:

ld	Туре	Description	
DfOverF	group	op level group for DfOverF.	
. help (attr)	text	Value is the string "Df/f over time of one or more ROIs. TimeSeries names should correspond to imaging plane names". (const)	
. <roiresponseseries> group ROI responses over an imaging plane.</roiresponseseries>		no	

#### **EventDetection**

Detected spike events from voltage trace(s).

*EventDetection* includes all elements of <*Interface*> with the following additions orchanges:

Id	Туре	Description	Required
EventDetection	group	Top level group for EventDetection.	yes
. detection_method		Description of how events were detected, such as voltage threshold, or dV/dT threshold, as well as relevant values.	yes
. source_electricalseries	link; target type= <electricalseries></electricalseries>	HDF5 link to ElectricalSeries that this data was calculated from. Metadata about electrodes and their position can be read from that ElectricalSeries so it's not necessary to mandate that information be stored here	yes
. source_electricalseries_path	text	Path to linked ElectricalSeries. (Automatically created)	yes
. source_idx	int32 array; dims: ['num_events']	Indices (zero-based) into source ElectricalSeries::data array corresponding to time of event. Module description should define what is meant by time of event (e.g., .25msec before action potential peak, zero-crossing time, etc). The index points to each event from the raw data	yes
. times	float64! array; dims: ['num_events']	Timestamps of events, in Seconds	yes

#### **EventWaveform**

Represents either the waveforms of detected events, as extracted from a raw data trace in acquisition, or the event waveforms that were stored during experiment acquisition.

*EventWaveform* includes all elements of <*Interface*> with the following additions orchanges:

ld	Туре	Description	Required
EventWaveform	group	Top level group for EventWaveform.	yes
<u>. help (attr)</u>	text	Value is the string "Waveform of detected extracellularly recorded spike events". (const)	no

#### **EyeTracking**

Eye-tracking data, representing direction of gaze.

EveTracking includes all elements of <Interface> with the following additions orchanges:

ld	Туре	Description	Required
EyeTracking	group	pp level group for EyeTracking.	
<u>. help (attr)</u>	text	alue is the string "Eye-tracking data, representing direction of gaze". (const)	
. <spatialseries></spatialseries>	group	Direction, e.g., of gaze or travel, or position.	no

#### **FeatureExtraction**

Features, such as PC1 and PC2, that are extracted from signals stored in a SpikeEvent TimeSeries or other source.

FeatureExtraction includes all elements of < Interface > with the the following additions or changes:

ld	Туре	Description	Required
FeatureExtraction	group	Top level group for FeatureExtraction.	yes
. help (attr)	text	Value is the string "Container for salient features of detected events". (const)	no
. description	next array ours from tealures t	Description of features (eg, "PC1") for each of the extracted features.	yes
. electrode_lax	[[num_cnannels]	Indices (zero-based) to electrodes described in the experiment's electrode map array (under /general/extracellular_ephys).	yes
. features	float32 array; dims: ['num_events', 'num_channels', 'num_features']	Multi-dimensional array of features extracted from each event.	yes
. times	float64! array; dims: ['num_events']	Times of events that features correspond to (can be a link).	yes

#### **FilteredEphys**

Ephys data from one or more channels that has been subjected to filtering. Examples of filtered data include Theta and Gamma (LFP has its own interface). FilteredEphys modules publish an ElectricalSeries for each filtered channel or set of channels. The name of each ElectricalSeries is arbitrary but should be informative. The source of the filtered data, whether this is from analysis of another time series or as acquired by hardware, should be noted in each's TimeSeries::description field. There is no assumed 1::1 correspondence between filtered ephys signals and electrodes, as a single signal can apply to many nearby electrodes, and one electrode may have different filtered (e.g., theta and/or gamma) signals represented.

FilteredEphys includes all elements of < Interface > with the following additions or changes:

ld	Type	Description	Required
FilteredEphys	group	Top level group for FilteredEphys.	yes
. help (attr)	text	Value is the string "Ephys data from one or more channels that is subjected to filtering, such as for gamma or theta oscillations (LFP has its own interface). Filter properties should be noted in the ElectricalSeries". (const)	no
. <electricalseries></electricalseries>	group	Stores acquired voltage data from extracellular recordings.	yes

#### **Fluorescence**

Fluorescence information about a region of interest (ROI). Storage hierarchy of fluorescence should be the same as for segmentation (ie, same names for ROIs and for image planes). *Fluorescence* includes all elements of *<Interface>* with the following additions orchanges:

ld	Туре	Description	
Fluorescence	group	Top level group for Fluorescence.	yes
. help (attr)	text	Value is the string "Fluorescence over time of one or more ROIs. TimeSeries names should correspond to imaging plane names". (const)	no
. <roiresponseseries></roiresponseseries>	. <roiresponseseries> group ROI responses over an imaging plane.</roiresponseseries>		yes

## **ImageSegmentation**

Stores pixels in an image that represent different regions of interest (ROIs) or masks. All segmentation for a given imaging plane is stored together, with storage for multiple imaging planes (masks) supported. Each ROI is stored in its own subgroup, with the ROI group containing both a 2D mask and a list of pixels that make up this mask. Segments can also be used for masking neuropil. If segmentation is allowed to change with time, a new imaging plane (or module) is required and ROI names should remain consistent between them.

ImageSegmentation includes all elements of < Interface > with the the following additions or

changes:

ld	Туре	Description	Required
ImageSegmentation	group	Top level group for ImageSegmentation.	yes
. help (attr)	text	Value is ('Stores groups of pixels that define regions of interest from one or more imaging planes',) (const)	no
. <image_plane></image_plane>	group	Group name is human-readable description of imaging plane	no
<roi_name></roi_name>	group	Name of ROI	no
I Ima maek	float32 array; dims: ['num_x', 'num_y']	ROI mask, represented in 2D ([y][x]) intensity image	yes
pix_mask	uint16 array; dims: ['num_pixels', '2']	List of pixels (x,y) that compose the mask	yes
	float32 array; dims: ['num_pixels']	Weight of each pixel listed in pix_mask	yes
roi_description	text	Description of this ROI.	yes
description	text	Description of image plane, recording wavelength, depth, etc	recommended
imaging_plane_name	text	Name of imaging plane under general/optophysiology	yes
reference_images	group	Stores image stacks segmentation mask apply to.	yes
<image_name></image_name>	<imageseries> (group)</imageseries>	One or more image stacks that the masks apply to (can be one-element stack)	yes
roi_list	text array; dims: ['num_rois']	List of ROIs in this imaging plane (Automatically created)	yes

#### **ImagingRetinotopy**

Intrinsic signal optical imaging or widefield imaging for measuring retinotopy. Stores orthogonal maps (e.g., altitude/azimuth; radius/theta) of responses to specific stimuli and a combined polarity map from which to identify visual areas.

Note: for data consistency, all images and arrays are stored in the format [row][column] and [row, col], which equates to [y][x]. Field of view and dimension arrays may appear backward (i.e., y before x).

ImagingRetinotopy includes all elements of < Interface > with the the following additions or

changes:

dimension (attr) int32 array; dims: ['row_col'] Number of rows and columns in the image. NOTE: row, column representation is equivalent to height, width.  Size of viewing area, in meters recomn (attr) text Unit that axis data is stored in (e.g., degrees) yes  ['num_rows', Phase response to stimulus on the second measured axis yes	ld	Туре	Description	Required

#### Structured dimension(s):

Dimension	Componei	nts [ name (unit) ]
row_col	row (meter)	column (meter)

#### **LFP**

LFP data from one or more channels. The electrode map in each published ElectricalSeries will identify which channels are providing LFP data. Filter properties should be noted in the ElectricalSeries description or comments field.

LFP includes all elements of < Interface > with the following additions or changes:

ld	Туре	Description	Required
LFP	group	Top level group for LFP.	yes
<u>. help (attr)</u>		Value is the string "LFP data from one or more channels. Filter properties should be noted in the ElectricalSeries". (const)	no
. <electricalseries></electricalseries>	group	Stores acquired voltage data from extracellular recordings.	yes

#### **MotionCorrection**

An image stack where all frames are shifted (registered) to a common coordinate system, to

account for movement and drift between frames. Note: each frame at each point in time is assumed to be 2-D (has only x & y dimensions).

MotionCorrection includes all elements of < Interface > with the following additions or

changes:

ld	Туре	Description	Comment	Required	
MotionCorrection	group	Top level group for Motion	Top level group for MotionCorrection.		
. help (attr)	text		alue is the string "Image stacks whose frames have been shifted registered) to account for motion". (const)		
. <image stack<br=""/> name>	group	One of possibly many. N	lame should be informative.	yes	
corrected	<imageseries> (group)</imageseries>	Image stack with frames	shifted to the common coordinates.	yes	
original	link; target type= <lmageseries> (or subclass)</lmageseries>	HDF5 Link to image seri	es that is being registered.	yes	
original_path	text	Path to linked original tir	neseries (Automatically created)	yes	
xy_translation	<timeseries> (group)</timeseries>	Stores the x,y delta necessary to align each frame to the common coordinates, for example, to align each frame to a reference image.		yes	
data	float array; dims: ['num_times', 'xy']	TimeSeries for storing x,y offset for each image frame.		yes	
conversion (attr)	float32!	Scalar to multiply each element in data to convert it to the specified unit		yes	
resolution (attr)	float32!	Smallest meaningful difference between values in data, stored in the specified by unit.	E.g., the change in value of the least significant bit, or a larger number if signal noise is known to be present. If unknown, use NaN	yes	
unit (attr)	text		This is the SI unit (when appropriate) of the stored data, such as Volts. If the actual data is stored in millivolts, the field 'conversion' below describes how to convert the data to the specified SI unit.	yes	

#### Structured dimension(s):

Dimension	Components [ name (unit) ]	
xy	x (pixels)	y (pixels)

#### **Position**

Position data, whether along the x, x/y or x/y/z axis.

Position includes all elements of < Interface > with the following additions orchanges:

ld	Туре	Description	Required
Position	group	Top level group for Position.	yes
. help (attr)	text	Value is the string "Position data, whether along the x, xy or xyz axis". (const)	no
. <spatialseries></spatialseries>	group	Direction, e.g., of gaze or travel, or position.	yes

## **PupilTracking**

Eye-tracking data, representing pupil size.

PupilTracking includes all elements of < Interface > with the following additions or changes:

		<u></u>	
ld	Туре	Description	Required
PupilTracking	group	Top level group for PupilTracking.	yes
<u>. help (attr)</u>	text	Value is the string "Eye-tracking data, representing pupil size". (const)	no
. <timeseries></timeseries>	group	General purpose time series.	yes

#### **UnitTimes**

Event times of observed units (e.g. cell, synapse, etc.). The UnitTimes group contains a group for each unit. The name of the group should match the value in the source module, if that is possible/relevant (e.g., name of ROIs from Segmentation module).

*UnitTimes* includes all elements of <*Interface*> with the following additions or<u>changes</u>:

ld	Type	Description	Required
UnitTimes	group	Top level group for UnitTimes.	yes
<u>. help (attr)</u>	text	Value is the string "Estimated spike times from a single unit". (const)	no

. <unit_n></unit_n>	group	Group storing times for <unit_n>.</unit_n>	yes
source		Name, path or description of where unit times originated. This is necessary only if the info here differs from or is more fine-grained than the interface's source field	recommended
times	float64! array; dims: ['num_events']	Spike time for the units (exact or estimated)	yes
unit_description	text	Description of the unit (eg, cell type).	yes
. unit_list	text array; dims: ['num_units']	List of units present. (Automatically created)	yes

## File organization

#### Group: /acquisition

Acquired data includes tracking and experimental data streams (ie, everything measured from the system). If bulky data is stored in the /acquisition group, the data can exist in a separate HDF5 file that is linked to by the file being used for processing and analysis.

ld	Туре	Description	Description Comment		
. images	group	Acquired images (Aut	equired images (Automatically created)		
<image_x></image_x>	hinary	•	Name is arbitrary. Data is stored as a single binary object (HDF5 opaque type).	no	
description (attr)		Human description of image.	If image is of slice data, include slice thickness and orientation, and reference to appropriate entry in /general/slices	recommended	
format (attr)	text	Format of the image.	eg, jpg, png, mpeg	yes	
. timeseries	group	TimeSeries.	When importing acquisition data to an NWB file, all acquisition/tracking/stimulus data must already be aligned to a common time frame. It is assumed that this task has already been performed. (Automatically created)	yes	
<timeseries> or subtype</timeseries>		<annotationseries>, &lt; <electricalseries>, <i <indexseries>, <inter <patchclampseries></patchclampseries></inter </indexseries></i </electricalseries></annotationseries>	performed. (Automatically created)  TimeSeries> or any subtype. Subtypes include: <abstractfeatureseries>, AnnotationSeries&gt;, <currentclampseries>, <currentclampstimulusseries>, ElectricalSeries&gt;, <izeroclampseries>, <imagemaskseries>, <imageseries>, ndexSeries&gt;, <intervalseries>, <opticalseries>, <optogeneticseries>, PatchClampSeries&gt;, <roiresponseseries>, <spatialseries>, <spikeeventseries>, TimeSeries&gt;, <twophotonseries>, <voltageclampseries>, (oltageClampStimulusSeries&gt;)</voltageclampseries></twophotonseries></spikeeventseries></spatialseries></roiresponseseries></optogeneticseries></opticalseries></intervalseries></imageseries></imagemaskseries></izeroclampseries></currentclampstimulusseries></currentclampseries></abstractfeatureseries>		

When converting data from another format into NWB, there will be times that some data, particularly the raw data in *acquisition* and *stimulus*, is not included as part of the conversion. In such cases, a *TimeSeries* should be created that represents the missing data, even if the contents of that *TimeSeries* are empty. This helps to interpret the data in the file.

## Group: /analysis

The file can store lab-specific and custom data analysis without restriction on its form or schema, reducing data formatting restrictions on end users. Such data should be placed in the analysis group. The analysis data should be documented so that it is sharable with other labs No members or attributes specified for this group

## Group: /epochs

An experiment can be separated into one or many logical intervals, with the order and duration of these intervals often definable before the experiment starts. In this document, and in the context of NWB, these intervals are called 'epochs'. Epochs have acquisition and stimulus data associated with them, and different epochs can overlap. Examples of epochs are the time when a rat runs around an enclosure or maze as well as intervening sleep sessions; the presentation of a set of visual stimuli to a mouse running on a wheel; or the uninterrupted presentation of current to a patch-clamped cell. Epochs can be limited to the interval of a particular stimulus, or they can span multiple stimuli. Different windows into the same time series can be achieved by including multiple instances of that time series, each with different start/stop times.

ld	Туре	Description	Comment	Required

. tags (attr)		A sorted list of the different tags used by epochs.	This is a sorted list of all tags that are in any of the <epoch_x>/tags datasets`. (Automatically created)</epoch_x>	yes
. <epoch_x></epoch_x>		One of possibly many different experimental epoch	Name is arbitrary but must be unique within the experiment.	no
links (attr)	text array; dims: num_links	name assigned to group <timeseries< td=""><td>r in the list has the following format: Series", where <timeseries_x> is the s_X&gt; (below). Note that the name and es and the word "is" (with a single space mple list element: "'auditory_cue' is</timeseries_x></td><td>yes</td></timeseries<>	r in the list has the following format: Series", where <timeseries_x> is the s_X&gt; (below). Note that the name and es and the word "is" (with a single space mple list element: "'auditory_cue' is</timeseries_x>	yes
neurodata_type (attr)	text	The string "Epoch"		yes
<timeseries_x></timeseries_x>	group		Name is arbitrary and does not have to match the TimeSeries that it refers to.	no
count	int32	Number of data samples available in	this time series, during this epoch.	yes
idx_start	unisz	Epoch's start index in TimeSeries data[] field.	This can be used to calculate location in TimeSeries timestamp[] field	yes
timeseries	link; target type= <timeseries> (or subclass)</timeseries>	Link to TimeSeries. An HDF5 soft-link	k should be used.	yes
description	text	Description of this epoch ( <epoch_x></epoch_x>	>).	no
start_time	float64!	Start time of epoch, in seconds		yes
stop_time	float64!	Stop time of epoch, in seconds		yes
tags	lext array; dims:	User-defined tags used throughout the epochs. Tags are to help identify or categorize epochs.	E.g., can describe stimulus (if template) or behavioral characteristic (e.g., "lick left")	no

#### **Group:** /general

General experimental metadata, including animal strain, experimental protocols, experimenter, devices, etc, are stored under 'general'. Core metadata (e.g., that required to interpret data fields) is stored with the data itself, and implicitly defined by the file specification (eg, time is in seconds). The strategy used here for storing non-core metadata is to use free-form text fields, such as would appear in sentences or paragraphs from a Methods section. Metadata fields are text to enable them to be more general, for example to represent ranges instead of numerical values. Machine-readable metadata is stored as attributes to these free-form datasets.

All entries in the below table are to be included when data is present. Unused groups (e.g., intracellular\_ephys in an optophysiology experiment) should not be created unless there is data to store within them.

ld	Туре	Description	Comment	Required
custom	int	TIndicates that this group (general/) is the default location for custom nodes. This dataset in the format specification is just a flag. There is no actual data stored in the HDF5 file for this data sets.		no
. data_collection	text	Notes about data collection and analysis.	Can be from Methods	no
. devices	group	Description of hardware devices used during experiment.	Eg, monitors, ADC boards, microscopes, etc	no
<device_x></device_x>	text	One of possibly many. Information about device and device description.	Name should be informative. Contents can be from Methods.	no
. experiment_description	text	General description of the experiment.	Can be from Methods	recommended
. experimenter	text	Name of person who performed the experiment.	More than one person OK. Can specify roles of different people involved.	recommended
. extracellular_ephys	group	Metadata related to extracellular electrophysiology.		no
. institution	text	Institution(s) where experiment was performed		recommended
. intracellular_ephys	group	Metadata related to intracellular electrophysiology		no
. lab	text	Lab where experiment was pe	rformed	recommended

. notes	text	Notes about the experiment.	Things particular to this experiment	no
. optogenetics	group	Metadata describing optogene	etic stimuluation	no
. optophysiology	group	Metadata related to optophysic	ology.	no
. pharmacology		Description of drugs used, including how and when they were administered.	Anesthesia(s), painkiller(s), etc., plus dosage, concentration, etc.	no
. protocol	text	Experimetnal protocol, if applicable.	E.g., include IACUC protocol	no
. related_publications	text	Publication information.	PMID, DOI, URL, etc. If multiple, concatenate together and describe which is which. such as PMID, DOI, URL, etc	no
. session_id	text	Lab-specific ID for the session.	Only 1 session_id per file, with all time aligned to experiment start time.	recommended
. slices	text	Description of slices, including thickness, orientation, temperature of the control of the contr	information about preparation ature and bath solution	no
. source_script	text	Script file used to create this N	IWB file.	no
file_name (attr)	text	Name of script file		no
. specifications	group	Group for storing format speci-	fication files.	no
<specification_file></specification_file>		Dataset for storing contents of a specification file for either the core format or an extension. Name should match name of file.`		no
help (attr)	text	Value is the string "Contents of format specification file.".		no
namespaces (attr)	text array; dims: ['num_namespaces']	Namespaces defined in the file	е	yes
. stimulus		Notes about stimuli, such as how and where presented.	Can be from Methods	no
. subject	group	Information about the animal c measured.	or person from which the data was	no
age	text	Age of subject		no
description		Description of subject and whe	ere subject came from (e.g., breeder,	no
genotype	text	Genetic strain	If absent, assume Wild Type (WT)	no
sex	text	Gender of subject	, ,	no
species	text	Species of subject		no
subject_id	IIAXI	ID of animal/person used/participating in experiment (lab		no
weight		Weight at time of experiment, at time of surgery and at other		no
. surgery	text	Narrative description about surgery/surgeries, including date(s) and who performed surgery.	Much can be copied from Methods	no
. virus		Information about virus(es) us ID, source, date made, injectio	ed in experiments, including virus on location, volume, etc	no

# Group: /general/extracellular\_ephys Metadata related to extracellular electrophysiology.

ld	Type	Description	Comment	Required
. <electrode_group_x></electrode_group_x>	group		Name is arbitrary but should be meaningful.	yes
description	text	Description of probe or shank		yes
device	text	Name of device(s) in /general/device	es	yes
location	text	Description of probe location	E.g., stereotaxic coordinates and other data, e.g., drive placement, angle and orientation and tetrode location in drive and tetrode depth	yes
		Identification string for probe, shank	There's one entry here for each element in electrode_map. All	

. electrode_group	text array; dims: ['num_electrodes']		elements in an electrode group should have a functional association, for example all being on the same planar electrode array, or on the same shank.	yes
. electrode_map	number array; dims: ['num_electrodes', 'xyz']	Physical location of electrode, (x,y,z in meters)	Location of electrodes relative to one another. This records the points in space. If an electrode is moved, it needs a new entry in the electrode map for its new location. Otherwise format doesn't support using the same electrode in a new location, or processing spikes pre/post drift.	yes
. filtering	text	Description of filtering used.	Includes filtering type and parameters, frequency fall- off, etc. If this changes between TimeSeries, filter description should be stored as a text attribute for each TimeSeries. If this changes between TimeSeries, filter description should be stored as a text attribute for each TimeSeries.	yes
. impedance	text array; dims: ['num_electrodes']	Impedence of electrodes listed in electrode_map.	Text, in the event that impedance is stored as range and not a fixed value	yes

Structured dimension(s):

Dimension	Com	<b>ponents</b> [ na	me (unit) ]
xyz	x (meter)	y (meter)	z (meter)

## **Group:** /general/intracellular\_ephys

Metadata related to intracellular electrophysiology

ld	Туре	Description	Comment	Required
. <electrode_x></electrode_x>	group	One of possibly many.	Name should be informative.	yes
description		Recording description, description of electrode (e.g., whole-cell, sharp, etc)	Free-form text (can be from Methods)	yes
device	text	Name(s) of devices in ge	neral/devices	no
filtering	text	Electrode specific filtering	J.	no
initial_access_resistance	text	Initial access resistance		no
location	text	Area, layer, comments or	n estimation, stereotaxis coordinates (if in vivo, etc)	no
resistance	text	Electrode resistance	unit: Ohm	no
seal	text	Information about seal us	ed for recording	no
slice	text	Information about slice us	sed for recording	no
. filtering	text		Includes filtering type and parameters, frequency fall- off, etc. If this changes between TimeSeries, filter description should be stored as a text attribute for each TimeSeries.	no

# **Group: /general/optogenetics**Metadata describing optogenetic stimuluation

ld	Туре	Description	Comment	Required
. <site_x></site_x>	group	One of possibly many groups describing an optogenetic stimuluation site.	Name is arbitrary but should be meaningful. Name is referenced by OptogeneticSeries	no
description	text	Description of site		yes
device	text	Name of device in /general/devices		yes
excitation_lambda	text	Excitation wavelength		yes
location	text	Location of stimulation site		yes

## **Group: /general/optophysiology**

Metadata related to optophysiology.

ld	Туре	Description	Comment	Required
			Name is arbitrary but should be	

. <imaging_plane_x></imaging_plane_x>	group	One of possibly many groups describing an imaging plane.	meaningful. It is referenced by TwoPhotonSeries and also ImageSegmentation and DfOverF interfaces	no
<channel_x></channel_x>	group	One of possibly many groups storing channel- specific data	Name is arbitrary but should be meaningful	yes
description	text	Any notes or comments about the channel		yes
emission_lambda	text	Emission lambda for channel		yes
description	text	Description of <image_plane_x></image_plane_x>		no
device	text	Name of device in /general/devices		yes
excitation_lambda	text	Excitation wavelength		yes
imaging_rate	text	Rate images are acquired, in Hz.		yes
indicator	text	Calcium indicator		yes
location	text	Location of image plane		yes
	float32 array; dims: ['height', 'weight', 'xyz']	Physical position of each pixel.	"xyz" represents the position of the pixel relative to the defined coordinate space	yes
conversion (attr)	float	Multiplier to get from stored values to specified unit	(e.g., 1e-3 for millimeters)	yes
unit (attr)	text	Base unit that coordinates are stored in (e.g., Meters)		yes
reference_frame	text	Describes position and reference frame of manifold based on position of first element in manifold. For example, text description of anotomical location or vectors needed to rotate to common anotomical axis (eg, AP/DV/ML).	This field is necessary to interpret manifold. If manifold is not present then this field is not required	yes

Structured dimension(s):

Dimension	Components [ name (unit) ]		
xyz	x (Meter)	y (Meter)	z (Meter)

## **Group: /processing**

'Processing' refers to intermediate analysis of the acquired data to make it more amenable to scientific analysis. These are performed using Modules, as defined above. All modules reside in the processing group.

ld	Туре	Description	Comment	Required
. <module></module>	group	Module. Name should be descriptive. Stores a collection of related data organized by contained interfaces. Each interface is a contract specifying content related to a particular type of data.		
description (attr)	text	Description of Module		no
interfaces (attr) text array; dims: ['num_interfaces		Names of the data interfaces offered by this module.		
neurodata_type (attr)	text	The string "Module"		yes
<interface> subtype</interface>		Any subtype of <interface>. These include: BehavioralEpochs, BehavioralEvents, BehavioralTimeSeries, ClusterWaveforms, Clustering, CompassDirection, DfOverF, EventDetection, EventWaveform, EyeTracking, FeatureExtraction, FilteredEphys, Fluorescence, ImageSegmentation, ImagingRetinotopy, LFP, MotionCorrection, Position, PupilTracking, UnitTimes</interface>		no

## **Group: /stimulus**

Stimuli are here defined as any signal that is pushed into the system as part of the experiment (eg, sound, video, voltage, etc). Many different experiments can use the same stimuli, and stimuli can be re-used during an experiment. The stimulus group is organized so that one version of template stimuli can be stored and these be used multiple times. These templates can exist in the present file or can be HDF5-linked to a remote library file.

ld	Туре	Description	Comment	Required
. presentation	group	Stimuli preser	Stimuli presented during the experiment. (Automatically created)	
		<timeseries></timeseries>	or any subtype. Subtypes include: <abstractfeatureseries>,</abstractfeatureseries>	

<timeseries> or subtype</timeseries>	group	<annotationseries>, <currentclampseries>, <currentclampstimulusseries>, <electricalseries>, <izeroclampseries>, <imagemaskseries>, <imageseries>, <indexseries>, <intervalseries>, <opticalseries>, <optogeneticseries>, <patchclampseries>, <roiresponseseries>, <spatialseries>, <spikeeventseries>, <timeseries>, <twophotonseries>, <voltageclampseries>, <voltageclampstimulusseries></voltageclampstimulusseries></voltageclampseries></twophotonseries></timeseries></spikeeventseries></spatialseries></roiresponseseries></patchclampseries></optogeneticseries></opticalseries></intervalseries></indexseries></imageseries></imagemaskseries></izeroclampseries></electricalseries></currentclampstimulusseries></currentclampseries></annotationseries>		no
. templates	group		Time stamps in templates are based on stimulus design and are relative to the beginning of the stimulus. When templates are used, the stimulus instances must convert presentation times to the experiment's time reference frame. (Automatically created)	
<timeseries> or subtype</timeseries>	group	<timeseries> or any subtype. Subtypes include: <abstractfeatureseries>, <annotationseries>, <currentclampseries>, <currentclampstimulusseries>, <electricalseries>, <izeroclampseries>, <imagemaskseries>, <imageseries>, <indexseries>, <intervalseries>, <opticalseries>, <optogeneticseries>, <patchclampseries>, <roiresponseseries>, <spatialseries>, <spikeeventseries>, <timeseries>, <twophotonseries>, <voltageclampseries>, <voltageclampstimulusseries></voltageclampstimulusseries></voltageclampseries></twophotonseries></timeseries></spikeeventseries></spatialseries></roiresponseseries></patchclampseries></optogeneticseries></opticalseries></intervalseries></indexseries></imageseries></imagemaskseries></izeroclampseries></electricalseries></currentclampstimulusseries></currentclampseries></annotationseries></abstractfeatureseries></timeseries>		no

## **Extending the format**

The data organization presented in this document constitutes the *core* NWB format. Extensibility is handled by allowing users to store additional data as necessary using new datasets, attributes or groups. There are two ways to document these additions. The first is to add an attribute "schema\_id" with value the string "Custom" to the additional groups or datasets, and provide documentation to describe the extra data if it is not clear from the context what the data represent. This method is simple but does not include a consistant way to describe the additions. The second method is to write an *extension* to the format. With this method, the additions are describe by the extension and attribute "schema\_id" is set to the string "namespace:id" where namespace is the namespace of the extension, and *id* is the identifier of the structure within the namespace. Extensions to the format are written using the same specification language that is used to define the core format. Creating an extension allows adding the new data to the file through the API, validating files containing extra data, and also generating documentation for the additions. Popular extensions can be proposed and added to the official format specification. Writing and using extensions are described in the API documentation. Both methods allow extensibility without breaking backward compatibility.

The Neurodata Without Borders: Neurophysiology Initiative is funded by GE, the Allen Institute for Brain Science, the Howard Hughes Medical Institute (HHMI), The Kavli Foundation and the International Neuroinformatics Coordinating Facility. Our founding scientific partners are the Allen Institute, the Svoboda Lab at the Janelia Research Campus of HHMI, the Meister Lab at the California Institute of Technology, the Buzsaki Lab at New York University School of Medicine, and the University of California, Berkeley. Ovation.io is our founding development partner. Ken Harris at University College London provided invaluable input and advice.

## **Change history**

1.0.3-Beta June 2016

Generate documentation directly from format specification file."

Change ImageSeries external\_file to an array. Added attribute starting\_frame.

Made TimeSeries description and comments recommended.

Added IZeroClampSeries.`

1.0.3 April, 2016

Renamed "ISI\_Retinotopy" to "ISIRetinotopy" Change ImageSeries external\_file to an array. Added attribute starting\_frame. Added IZeroClampSeries.

1.0.2 February, 2016

Fixed documentation error, updating 'neurodata\_version' to 'nwb\_version'

Created ISI Retinotopy interface

In ImageSegmentation module, moved pix\_mask::weight attribute to be its own dataset, named pix\_mask\_weight. Attribute proved inadequate for storing sufficiently large array data for some segments

Moved 'gain' field from Current/VoltageClampSeries to parent PatchClampSeries, due need of stimuli to sometimes store gain

Added Ken Harris to the Acknowledgements section

#### 1.0.1 October 7th, 2015

Added 'required' field to tables in the documentation, to indicate if group/dataset/attribute is required, standard or optional

Obsoleted 'file\_create\_date' attribute 'modification\_time' and made file\_create\_date a text array Removed 'resistance\_compensation' from CurrentClampSeries due being duplicate of another field

Upgraded TwoPhotonSeries::imaging plane to be a required value

Removed 'tags' attribute to group 'epochs' as it was fully redundant with the 'epoch/tags' dataset Added text to the documentation stating that specified sizes for integer values are recommended sizes, while sizes for floats are minimum sizes

Added text to the documentation stating that, if the TimeSeries::data::resolution attribute value is unknown then store a NaN

1.0.0 September 28<sup>th</sup>, 2015 Convert document to .html

## **Design notes**

1.0.1

Declaring the following groups as required (this was implicit before)

acquisition/

- \_ images/
- \_ timeseries/

analysis/

epochs/

general/

processing/

stimulus/

- \_ presentation/
- \_ templates/

This is to ensure consistency between .nwb files, to provide a minimum expected structure, and to avoid confusion by having someone expect time series to be in places they're not. I.e., if 'acquisition/timeseries' is not present, someone might reasonably expect that acquisition time series might reside in 'acquisition/'. It is also a subtle reminder about what the file is designed to store, a sort of built-in documentation. Subfolders in 'general/' are only to be included as needed. Scanning 'general/' should provide the user a quick idea what the experiment is about, so only domain-relevant subfolders should be present (e.g., 'optogenetics' and 'optophysiology'). There should always be a 'general/devices', but it doesn't seem worth making it mandatory without making all subfolders mandatory here.

TwoPhotonSeries::imaging\_plane was upgraded to mandatory to help enforce inclusion of important metadata in the file.

The listed size of integers is the suggested size. What's important for integers is simply that the integer is large enough to store the required data, and preferably not larger. For floating point, double is required for timestamps, while floating point is largely sufficient for other uses. This is why doubles (float64) are stated in some places. Because floating point sizes are provided,

integer sizes are provided as well.

## Why do timestamps\_link and data\_link record linking between datasets, but links between epochs and timeseries are not recorded?

Epochs have a hardlink to entire timeseries (ie, the HDF5 group). If 100 epochs link to a time series, there is only one time series. The data and timestamps within it are not shared anywhere (at least from the epoch linking). An epoch is an entity that is put in for convenience and annotation so there isn't necessarily an important association between what epochs link to what time series (all epochs could link to all time series).

The timestamps\_link and data\_link fields refer to links made between time series, such as if timeseries A and timeseries B, each having different data (or time) share time (or data). This is much more important information as it shows structural associations in the data.
